Summary Statistics for Total Scores

The table below gives the Number of Examinees, Average Reported Score, Standard Deviation, Reliability, Standard Error of Measurement, and Standard Error of Scoring for many of the Texas tests. A glossary providing information about these statistics is provided at the end of this document.

Test Code	Test Name	Number of Examinees	Average Reported Score	Standard Deviation	Reliability	Standard Error of Measurement	Standard Error of Scoring
005	Art All Level	308	77.12	9.92	0.93	2.66	n/a
006	Art Secondary	43	77.14	8.79	0.87	3.51	n/a
047	Spanish 6-12	1479	83.48	10.91	0.94	3.46	n/a
048	French 6-12	153	79.63	12.02	0.91	3.6	n/a
049	German 6-12	51	81.69	15.22	n/a	n/a	n/a
050	Latin 6-12	17	75.88	15.22	n/a	n/a	n/a
064	Superintendent Part I and Part II	457	248.55	18.08	0.7	9.9	n/a
068	Principal	4465	248.65	17.09	0.8	7.95	n/a
072a	Texas Assessment of Sign Communication (TASC)	42	3.14	1.04	n/a	n/a	n/a
073ª	Texas Assessment of Sign Communication (TASC-ASL)	68	2.71	1.36	n/a	n/a	n/a

^a For test codes 072 and 073, the summary statistics are calculated by converting alphabetic scores reported to candidates to numeric scores (A = 5, B = 4, C = 3, D = 2, E = 1).

^b These tests are offered via both paper-and-pencil (PBT) and computer-administered testing (CAT). In some instances, the summary statistics are based on

PBT data only.

Glossary of Terms

Number of Examinees — Represents the annual volume for the 2007-08 testing year. If an examinee took a test more than once within this period, that person is only counted once.

Average Reported Score — Mean reported score of test takers who tested during the 2007-08 testing year. If an examinee took a test more than once within this period, only the most recent score was used in this calculation.

Standard Deviation — Standard deviation of the reported score of test takers who tested during the 2007-08 testing year. If an examinee took a test more than once within this period, only the most recent score was used in this calculation.

Reliability — The tendency of individual scores to be consistent from one version of the test to another. For mixed-format tests (i.e., multiple-choice and constructed-response) with fewer than two constructed-response questions, reliability is calculated for only the multiple-choice portion of the test. For tests with insufficient data, reliability is not calculated.

Standard Error of Measurement — A statistic that is often used to describe the expected variation in a test score if an individual is retested many times with parallel forms of a test. An examinee's score on a single version of a test will differ somewhat from the score the examinee would get on a different version of the test. The more consistent the scores from one version of the test to another, the smaller the standard error of measurement. If a large number of examinees take a test for which the standard error of measurement is 3 points, about two-thirds of the examinees will receive scores within 3 points of the scores that they would get by averaging over many versions of the test. On some tests, the standard error of measurement could not be estimated because there was no version of the test that had been taken by a sufficient number of examinees. On other tests, the standard error of measurement could not be adequately estimated because the test consists of a very small number of questions or tasks, each measuring a different type of knowledge or skill. Finally, for tests containing both multiple-choice and constructed-response questions where the number of constructed-response questions is less than two, the standard error of measurement for the reported score could not be estimated.

Standard Error of Scoring — For tests with constructed-response components where the scoring involves human judgment, this statistic describes the reliability of the process of scoring the examinees' responses. The more consistent the ratings assigned to the same responses by different scorers, the smaller the standard error of scoring. If a large number of examinees take a test for which the standard error of scoring is 1 point, about two-thirds of the examinees will receive scores within 1 point of the scores that they would get if their responses were scored by all possible scorers. On some constructed-response tests, the standard error of scoring could not be estimated because there was no version of the test that had been taken by a sufficient number of examinees. On some constructed-response tests, the standard error of scoring could not be estimated because the responses were not all scored independently by two different scorers. The standard error of scoring for a multiple-choice test, or a domain or competency score consisting of only multiple-choice questions, is not applicable because multiple-choice scoring is a purely mechanical process with no possibility of disagreement between scorers.
